Cauchy–Schwarz inequality. If X and Y are random variables with finite variances, then $[\text{cov}(X, Y)]^2 \leq \text{var}(X) \text{var}(Y)$.

Markov’s inequality. Let X be a random variable that satisfies $\Pr(X \geq 0) = 1$. If $\mathbf{E}[X]$ exists, then for every real number $t > 0$, $\Pr(X \geq t) \leq \frac{\mathbf{E}[X]}{t}$.

Chebyshev’s inequality. Let X be a random variable with finite mean. If $\text{var}(X)$ exists, then for every real number $t > 0$, $\Pr(|X - \mathbf{E}[X]| \geq t) \leq \frac{\text{var}(X)}{t^2}$.

For any real number α , the following equation is true:

$$e^\alpha = \exp(\alpha) = \sum_{k=0}^{\infty} \frac{\alpha^k}{k!} = 1 + \alpha + \frac{\alpha^2}{2} + \frac{\alpha^3}{6} + \dots$$

Table III, "Table of the t Distribution" from STATISTICAL TABLES FOR BIOLOGICAL, AGRICULTURAL, AND MEDICAL RESEARCH by R.A. Fisher and F. Yates. © 1963 by Pearson Education, Ltd.

This is the **first of two pages** for the χ^2 distribution.

If X has a χ^2 distribution with m degrees of freedom, this table gives the value of such that $\Pr(X \leq x) = p$, the p quantile of X .
